

PROTECT BALI'S ENVIRONMENT!

Did you know that one of the main causes of pollution in our world today is farming?

- Everyday, farmers use very strong chemicals in rice fields and on other crops.
- These chemicals spread into the air, waterways, and soil where they are used and from there they spread out even further to other places.

If they are dangerous, why do farmers use these chemicals?

- Once farmers start to use these chemicals, they need to continue using them and even use more and more chemicals, because the quality and health of the soil gets less fertile over time.
- These farming chemicals also create other environmental problems, like strong pests that attack the crops and are very hard to deal with.

What can we do?

- The most important thing we can do is to value the farmers that are trying to save local seeds and farm without using chemicals. That's called **ORGANIC FARMING**.
- Let your local shops and food sellers at the market know that you want to buy food that does not contain any chemicals.
